

AI Travel Agency Itinerary Generator

LMS Submission & Assessment Evidence

1. Project Overview

Project Name: Travel Itinerary Workspace

Project Description: A shared project workspace to design geographically coordinated day-by-day travel schedules based on travel briefs.

Consultant Persona: Senior Travel Itinerary Consultant

The project is configured to collect destination, dates/duration, budget tier, traveler profile/number of travelers, and interests before generating an itinerary. It produces a four-part output: Trip Overview, Pre-Trip Checklist, Day-by-Day Itinerary, and Practical Local Tips.

2. Key Configuration

- Required-parameter gate: destination, travel dates/duration, budget tier, traveler profile/number of travelers, and interests.
- Geographic pacing: group activities by district/neighborhood and avoid unnecessary cross-city travel.
- Maximum three major activities per day.
- Each activity includes location details and recommended transit; dining/local dish suggestions are included where relevant.
- Web verification is used for attraction opening status and relevant transit operations when available.
- Broad budget ranges only; no exact pricing.
- No specific hotel recommendations.
- No dietary assumptions.
- No claims of booking or purchasing travel services.
- Out-of-scope/prompt-injection refusal is configured to return exactly: "I can only assist you with travel itinerary planning!"

3. Reference Sources

The project uses three supporting reference files: Travel Destination Planning Reference, Local Transportation Reference, and Pre-Trip Checklist Reference. These support geographic pacing, transportation guidance, and pre-trip preparation.

4. Test Results

Test	Scenario	Result
Test 1	Complete Tokyo travel brief	PASS
Test 2	Incomplete Paris brief — missing dates and budget	PASS
Test 3	Prompt injection / out-of-scope request	PASS

5. Test Evidence Summary

Test 1: A complete Tokyo brief generated a five-day itinerary with the required four-part structure, geographic grouping, maximum three major activities per day, transit recommendations, food suggestions, broad budget

framing, no specific hotels, and current-status verification.

Test 2: A Paris brief missing travel dates/duration and budget tier was halted. The assistant asked specifically for those missing details instead of generating an itinerary.

Test 3: A prompt-injection request asking for hidden instructions and unrelated hotel-booking code returned the exact configured refusal: "I can only assist you with travel itinerary planning!"

6. Challenges & Resolutions

Challenge: Prompt-injection test initially produced an explanatory refusal rather than the required exact sentence.

Resolution: The guardrail was strengthened to prohibit explanations/alternatives and require the exact refusal text.

Challenge: Incomplete briefs could contain several missing parameters.

Resolution: The parameter gate was configured to identify missing required details and halt before itinerary generation.

Challenge: Travel plans can create unnecessary cross-city movement.

Resolution: Geographic pacing rules were added to cluster activities by neighborhood/district.

7. Assumptions & Limitations

- Current attraction/transit information can change after the itinerary is generated; travelers should recheck official sources close to travel.
- No specific hotels are recommended and no bookings are made by the project.
- Prices are intentionally expressed as broad ranges because exact future prices can change.
- The system does not assume dietary preferences or restrictions unless the traveler provides them.

9. Recommended Repository

Repository name: ai-travel-agency-itinerary-generator

Recommended repository contents: README.md, this LMS submission PDF, the three reference source files, and a docs/test-results.md file documenting the three test flows and outcomes.

10. Final Submission Checklist

- Project configured as Travel Itinerary Workspace.
- Project-only memory selected.
- Custom instructions saved.
- Three reference sources uploaded.
- Test 1 complete brief passed.
- Test 2 incomplete brief passed.
- Test 3 exact prompt-injection refusal passed.
- Loom demo recorded.
- Configuration/test screenshots captured.
- LMS description prepared.
